PORTFOLIO · CODE & AI

JOHN NORTHRUP

Architectural designer working across documentation, fabrication, and code.

I produce permit sets for city and county approval, carry fabrication from concept through install, and build Rhino, Grasshopper, and Python tools that speed up design work.

memoryMachine

SU26, M.ARCH THESIS
ADVISOR · CASEY REHM

memoryMachine is a computational design framework that transforms civic sentiment and archival memory into operative spatial data to revitalize under-utilized public space. Using Pershing Square in Downtown Los Angeles as a test bed—a civic site defined by a history of top-down, disconnected redesigns—the project proposes an adaptive spatial infrastructure in place of the fixed, one-time master plan.

At its core, a multimodal data ingestion engine aggregates web reviews, archival records, and spatial metrics, pairing qualitative sentiment with physical variables such as microclimate, canopy coverage, and circulation flows. To ensure equitable representation, the engine applies demographic weighting to mitigate digital access bias. These inputs are translated into spatial density fields and programmatic adjacencies, generating interventions—such as terraced landforms, water systems, and subterranean transit connections—as evidence-based spatial responses rather than predetermined formal gestures.

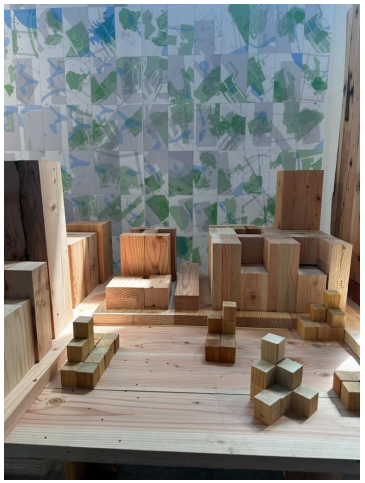

By merging expert analysis with experiential civic data, memoryMachine repositions the architect from sole author to system mediator. Public input shifts from a one-off consultation phase into a permanent, operative design parameter. The result is a self-regulating spatial framework that ingests usage patterns to continuously re-evaluate the site and adapt through phased physical interventions—establishing a democratic model in which public space evolves alongside the community it serves.

PROTOTYPE

SP26, PROTOTYPE, 3GB STUDIO

A generative pipeline for retail architecture and product design, built around a footwear brand's flagship storefront. Architectural iterations were produced through a custom Flux/ComfyUI pipeline, while the product line — a technical boot shown here in cutaway and colorway studies — was developed in parallel through a Gemini-based image pipeline. The two threads feed each other: the building's industrial material palette of raw wood, steel, and concrete is carried directly into the product's own construction and display.

INTERFACE ARCHITECTURE

3GA STUDIO
ADVISOR · CASEY REHM

A Cabinet of Curiosities that produces memory artifacts. The installation receives audio input from the surrounding space; language becomes image through translation of an LLM to 3D object creation via API calls (Meshy). Objects are automatically optimized for 3D printing — oriented, scaled, and combined through a Python pipeline.
